# Activity 1: Creating a Blog

**Course:** Web Application Development (COP3874)
**Student:** Lynroy Durand
**Blog:** DadliCode Technology Blog

For this activity, I developed a static technology blog for DadliCode, a technology business based in Antigua and Barbuda. The theme focuses on technology topics relevant to local businesses, public services, and the wider Caribbean region.

I used HTML to structure the pages and CSS to create the layout, typography, colors, responsive design, and navigation. The website contains a homepage, an About DadliCode page, and three complete blog posts with images. The posts cover digital government in Antigua and Barbuda, cybersecurity for Caribbean small businesses, and the opportunities and responsibilities of artificial intelligence in the region.

Visitors can move between pages using the navigation menu, open each article from its preview card, and return to the article listing. I also tested the design concept for smaller screens using responsive CSS rules. The site uses a static HTML/CSS approach and can be published using GitHub Pages or another static hosting service.

This activity helped me practise linking pages, organizing content, incorporating images, and building a website that presents a consistent business identity.

**Published website:** [INSERT PUBLISHED URL AFTER DEPLOYMENT]
